IMMUNIZATION

Below are the most important diseases for which vaccines are currently available:

RABIES - one of the world's most publicized and feared diseases, is always fatal. Rabies virus attacks the nervous system, and is transmitted chiefly through the bite of an infected animal.

DISTEMPER - is among a very contagious and fatal disease of the respiratory tract, gastro-intestinal tract, and nervous system. It is transmitted through contact with bodily and airborne secretions.

CANINE ADENOVIRUS TYPE 2 - is associated with infectious hepatitis and infectious tracheo bronchitis. It is spread through bodily and airborne secretions.

PARAINFLUENZA - is a common and highly contagious cause of infectious tracheo bronchitis. It is an airborne disease.

PAROVIRUS - is highly contagious, aggressive, and often fatal gastro-intestinal virus. It is transmitted through direct contact with infected animals, feces, and other objects that have traces of the virus.

LYME DISEASE - is transmitted through tick bites. It is difficult to diagnose in dogs because they do not show the same symptoms as humans. The most common sign described is that the dog is "walking on eggshells".

LEPTOSPIROSIS - is an infection that is contracted through skin contact with infected water, soil, mud, or the urine of an infected animal. It can be transmitted to humans.

BORDATELLA - is associated with respiratory (kennel cough). It can be transmitted to cats, rabbits, and humans. It is highly contagious and transmitted through the air and direct contact.

INFLUENZA - is one of the viral causes of kennel cough. It is highly contagious through contact with other infected dogs. The fatality rate is low, but most dogs have not been exposed or not been vaccinated for it.
